Module 1

1. Web design, web hosting, and domain name are the three things needed. Without all three, your website will either not function at all, be inaccessible to everyone on the world wide web or will be impossible to find on the world wide web.

2. A web server allows your published website to be viewed on the world wide web at any time and by anyone. FTP is a protocol for transferring files from computer to computer, and local files are files added by the owner of a website to update its users on new features. All three of these things allow people to visit your webpage, no matter where they are as long as they have access to the world wide web.

3. AFS space allows your files to be accessed in a variety of different ways.
